● Abstract

This research focuses on the development of our cabin noise prediction tool using the Finite-Difference Time-Domain method, and in-flight noise measurement in the JAXA's Jet-Flying Test Bed (FTB) "HISHO" with the aim of grasping the cabin noise characteristics.

● Reasons and benefits of using JAXA Supercomputer System

JSS was used to conduct the simulation of our cabin noise prediction method (FDTD), which needs the resource of JSS to deal with a large computational domain.

● Achievements of the Year

In the aircraft noise prediction in real scale, we increased the number of measurement data (structural vibration data) of the previous year, reprocessed them, performed reanalysis using them as boundary conditions, and considered improvement ideas.
